

Balanced Blend

18-18-18

GUARANTEED MINIMUM ANALYSIS

Total Nitrogen (N).....	18.00 %
Available Phosphoric Acid (P ₂ O ₅).....	18.00 %
Soluble Potash (K ₂ O).....	18.00 %
Sulphur (S).....	2.50 %

FEATURES

- Balanced 1:1:1 ratio
- For many different crops
- No micros
- Not safe for chloride sensitive crops such as blueberries

BENEFITS:

The 1:1:1 ratio works well for many different types of situations. This blend does not contain micronutrients, so it is relatively safe for a number of crops. However, it does contain chlorides and is not recommended for chloride sensitive crops such as blueberries.

DIRECTIONS:

These rates represent the needs of a medium textured soil. Heavy or muck soils may require less fertilizer. A lighter soil would possibly need an additional sidedressing of nitrogen. It is strongly recommended that the producer conduct tissue and soil tests. Fertilizer applications should be adjusted accordingly to avoid excessive build-up or deficiencies of one or more nutrients. All rates are in pounds per acre.

APPLICATION RATES:

Lettuce: 500 lbs pre-plant incorporated

Rhubarb: Young Plants: 300 lbs applied in the year of setting. Established: 250-300 lbs before growth starts, followed by 250-300 lbs after growth starts, followed by

an optional 3rd application of 250-300 lbs after harvest OR a fall manure application.

Spinach: 400 lbs pre-plant incorporated

Field Tomatoes: 500 lbs pre-plant incorporated

It is strongly recommended that the producer conduct tissue and soil tests. Fertilizer applications should be adjusted accordingly to avoid excessive build-up or deficiencies of one or more nutrients.

CAUTION:

Avoid contact with eyes and prolonged contact with skin. If eyes or skin are exposed, flush with water. Do not use on container stock or in greenhouse production. This is not a label; these guidelines are based on the experiences of producers in the Fraser Valley. Always refer to soil test results before use.
